

How SOG-systems work:

SOG optimizes camping toilets in two major ways:

- Use without any sanitary additives
The increased flow of oxygen guarantees optimal decomposition (similar to that of an aeration tank at a treatment plant).
- Enormous increase in comfort due to removal of unpleasant odours by suction
No more smells in the caravan's limited living spaces

The toilet's optimal air suction system and its associated increase in comfort throughout the sanitary facilities remains the same for all SOG-systems, despite different installation systems!

As soon as the high performance ventilator turns on and **THE BLADE VALVE STARTS TO OPEN**, our ventilation system will create a slight negative pressure in the cassette. This creates a "SOG" (suction) at the toilet's opening and fresh air will be sucked in, which acts like a seal preventing any unpleasant gases (= odours) from escaping the tank.

The fresh air that is drawn in also removes the new gases from the toilet bowl, which means that even when using the toilet no odours whatsoever will be perceived. The toilet remains odour free - even better than a home toilet!

The increased flow of oxygen accelerates the decomposition process of the tank contents to such a degree that chemical additives become a thing of the past. (Normal toilet paper can be used - no special paper required!)

The **SPECIALLY DESIGNED VENTILATOR** for SOG sanitary systems, achieves the desired effect by precisely coordinating the rotation frequency and only consumes 0.84 watts.

After automatically switching off, a closed system is formed that prevents odours from moving to the living spaces, while maintaining the exchange of air with the outside.

Both the SOG (door variant) and the SOG II make use of a specially tailored filter that directs the extracted gases towards the outside.

The systems: - SOG -

The door version:

Odours are extracted to the outside through a carbon filter, which is to be attached together with its filter casing to the exterior of the service hatch.

The filter casing is available for all kits in white, light grey and dark grey and can be painted over.

The roof version:

By using a special roof lead-through, we also offer you the possibility to ventilate your SOG installations through the roof.

The parts supplied by us have been specifically designed to fit to a drain pipe system which is available in camping shops.

The systems: - SOG II -

The floor version:

The SOG II offers the advantage of a filter cartridge, which can be easily positioned at different locations within the caravan. (e.g. in the garage, under the seat, in the double bottom or in the storage compartment).

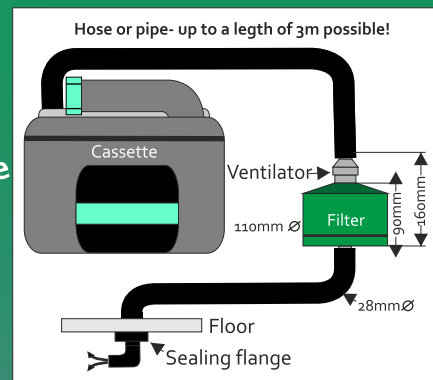

Ventilation takes place through the floor.

Installation examples: www.sog-dahmann.de

The specially developed filter casing and the filter material neutralise the extracted, odorous air completely! The system is therefore particularly suitable for caravans.

Highly optimized filtering technique

All three SOG types have the same effect!

The kits:

The SOG odor system is compatible with each Dometic or Thetford toilet!

Our patented systems are the only ones to allow gas extraction from the toilet bowl. We do not ventilate half-heartedly and not with simple means. There is no other way to do it without chemical additives.

All kits include:

- Ventilator – the centrepiece
- Adapter parts
- Set of cables including switch for ventilator power supply
- All small parts needed for assembly
- Very detailed assembly instructions

The kits contain:

The SOG door ventilation kit also includes:

- Filter casing
- A carbon filter

The SOG roof kit also includes:

- Roof lead-through

The SOG II floor kit also includes:

- Floor lead-through
- Filter cartridge

Please change filters once a year!

SOG

SOG II

Stiftung Warentest (the German „Which“) magazine 6/97 stated definitively that for all toilets with ventilation: „Chemical additives are completely superfluous, and these toilets may be used to the benefit of on's nose and the environment.“

Technology instead of chemicals!
